# 3 Things About Scientific Data Analytics

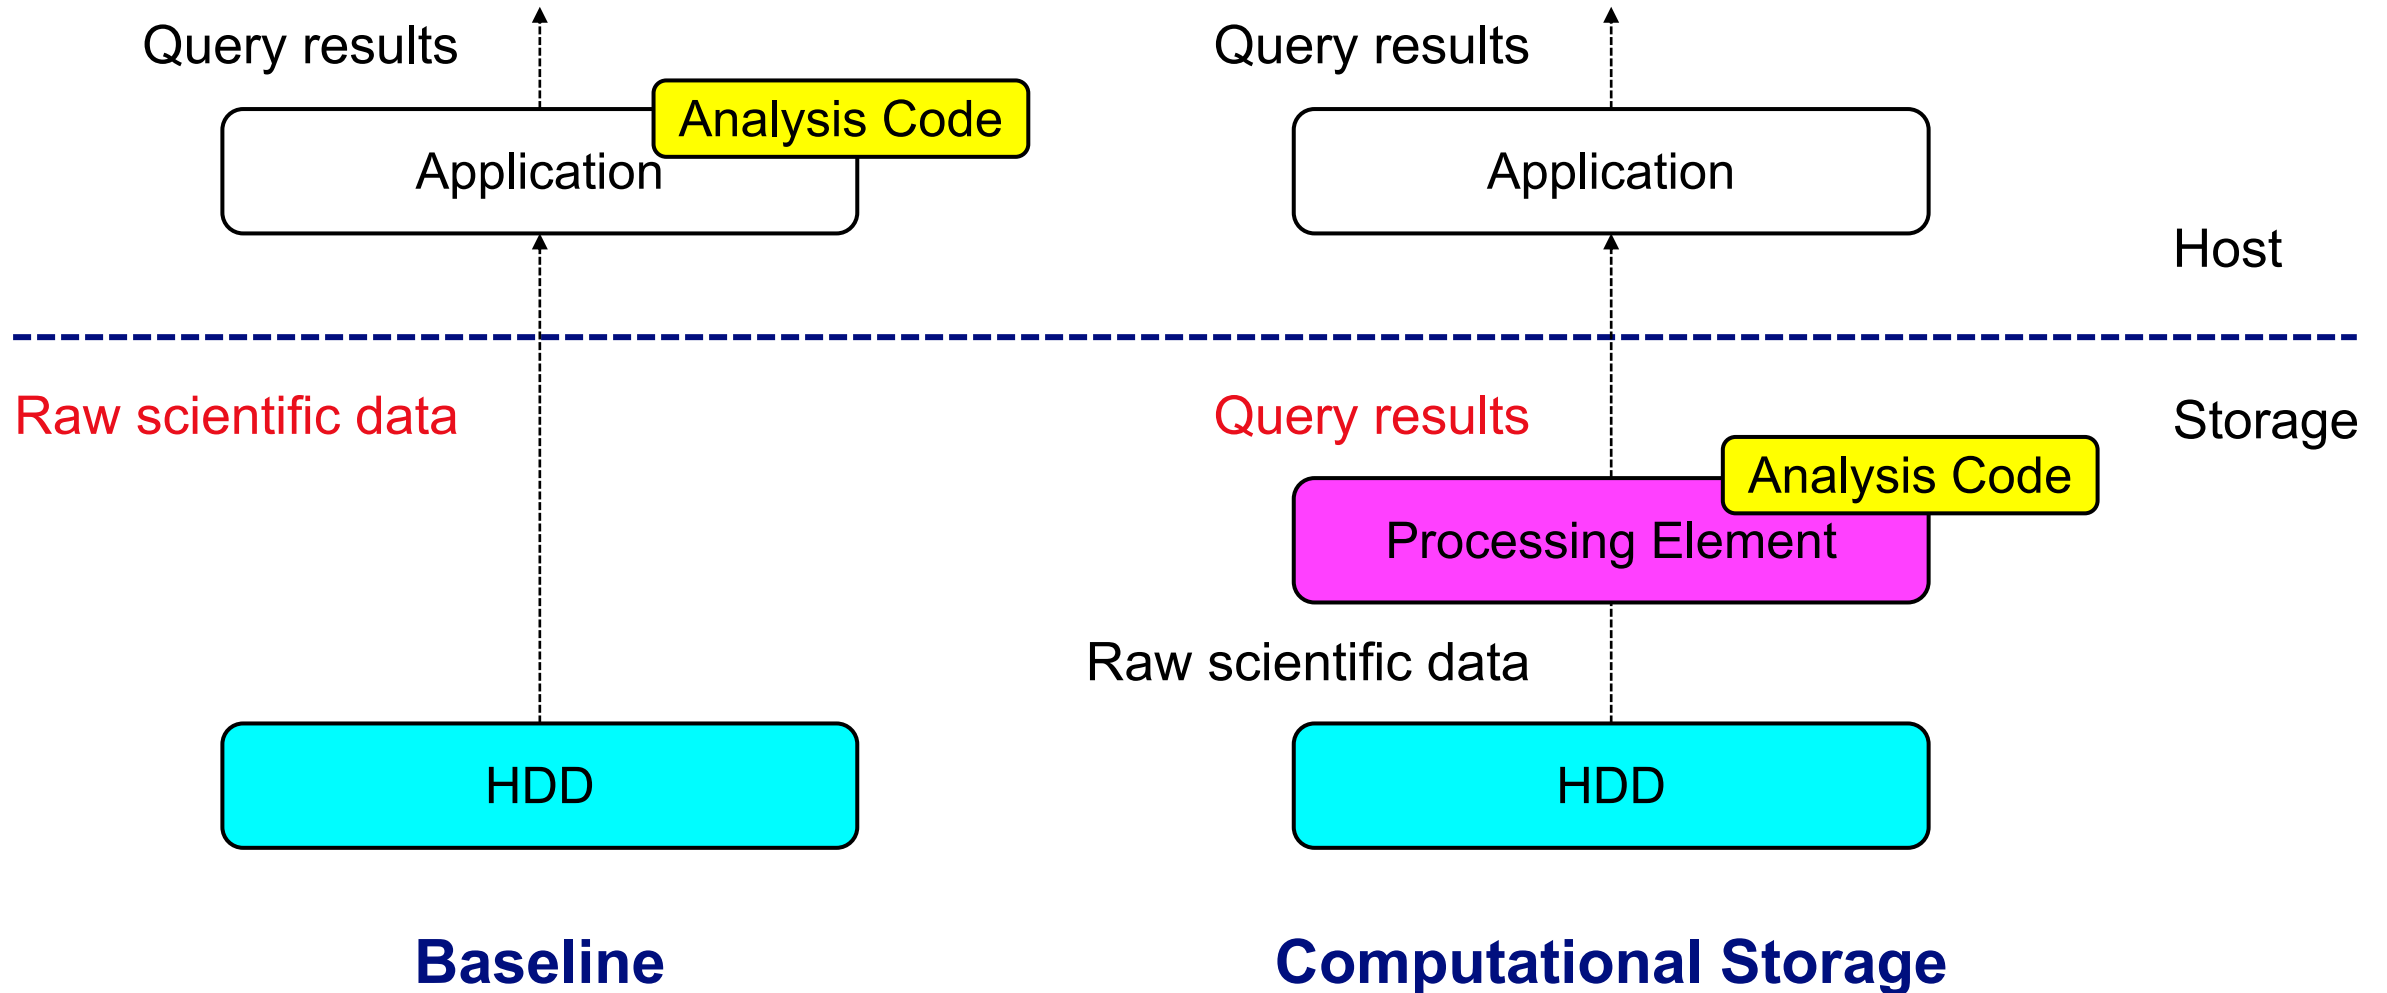

Data is big

Moving data is expensive

Queries often target a tiny portion of a large dataset

# Query Pushdown Through Computational Storage

# Data Agnostic vs Data Aware Offloads

## Data Agnostic

- Storage does not know what's in the data (see data as byte streams)
- What POSIX filesystems do today
- Examples: compression, encryption, custom risc-v, eBPF functions

## Data Aware

- Storage and apps agree on a data format (e.g., Apache Parquet) and a query format (e.g., Substrait)

This project will use the data aware approach

# Storage Interface: Block? KV? Object?

## Block

- Good for **data agnostic operations** (compression, encryption)

## KV

- Good for **row-based** applications such as various particle codes

Prior work at Los Alamos looked at these (ZIA, KV-CSD, C2) in collaboration with Aeon, Eideticom, Nvidia, SK hynix, Seagate

## Object (think of each as a Parquet fragment)

- Enable **columnar** analytics often seen in grid-based codes

This project will use objects
